

PHOTO QUALITY VALIDATION CHECKLIST

Ensure 100% first-time submission accuracy to protect your reputation

AUTOMATED AI METRICS (Check via Mobile App)

AI Metric	What It Detects	Target/Standard
Blur Score (0-5 scale)	Motion blur or focus issues that compromise assessment	Target: < 1
Brightness Score	Luminance histogram analysis prevents under/overexposed photos that hide defects	Balanced exposure (no pure white/black)
Angle Detection	Computer vision confirms full roofline visible and subject property centered	Full structure in frame; no obstructions
PII Content Filtering	Automatically flags and blocks photos containing people, body parts, or car mirrors	Zero PII visible
Metadata Integrity	AI cross-references image GPS coordinates with subject address to prevent "wrong house" errors	GPS within 50ft of parcel; timestamp matches inspection window

MANUAL INSPECTOR VERIFICATION (The Human Checkpoint)

☐	Verification Item
☐	Required Views Captured: Confirm all 7-10 mandatory views (front, sides, address, street signs, 2 occupancy indicators) are present
☐	No Car Obstructions: Verify no part of your own vehicle (windshield, hood, mirror) is visible in the frame
☐	Landscape Orientation: Confirm all photos were taken in landscape mode as required by standard protocols
☐	Objective Focus: Ensure photos document FACTS (e.g., visible roof wear) rather than trying to DIAGNOSE a failure
☐	Tamper-Proof Status: Verify that the system has successfully timestamped and geocoded the images for lender authentication
